

Electronic Warrant Solution

Tyler Technologies Acquires CloudGavel to Streamline Warrant Processes

CloudGavel complements Tyler's robust Enterprise Justice suite by streamlining warrant processing for all stakeholders. As warrants often require involvement from law enforcement officers, judicial officers, and prosecutors, CloudGavel's electronic capabilities allow all stakeholders to save valuable time and money with remote warrant creation, request, approval, oath administration, data sharing, and more.

CloudGavel is a cloud-based platform that allows users from any internet-connected device — from anywhere and at any time — to quickly initiate, document, and submit a state-specific warrant or subpoena to a duty judge for rapid review and electronic approval. Warrants can be efficiently shared between systems, eliminating laborious data entry and reducing errors. The platform also offers integrated video conferencing for administrative oaths that require affidavits.

How does it work?

Current warrant processing is time consuming and can involve many individuals traveling for physical signatures.

CloudGavel offers a better way:

Step 1

Officer or investigator uses the CloudGavel web app to generate a warrant.

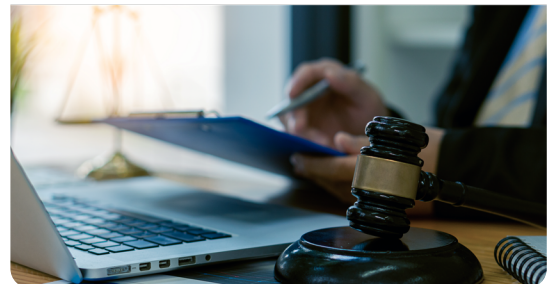

Step 2

The electronic warrant is securely sent to the prosecutor or judge for review.

Step 3

Judge approves warrant and it is sent back to the original requesting officer or investigator.
