

Electronic Warrant Solution

A Partnership Between Tyler Technologies and FusionStak Provides Innovative Solutions for the Public Safety Community With CloudGavel

CloudGavel will complement Tyler's robust Enterprise Justice suite by bringing Public Safety and Courts & Justice partners together to streamline warrant processing. Warrants often require involvement from law enforcement, judicial officers, and prosecutors. With CloudGavel's electronic capabilities, all stakeholders can save valuable time and money with remote warrant creation, request, approval, oath administration, data sharing, and more.

CloudGavel is a cloud-based platform that allows users from any internet-connected device — from anywhere and at any time — to quickly initiate, document, and submit a state-specific warrant or subpoena to a duty judge for rapid review and electronic approval. Warrants can be efficiently shared between systems, eliminating laborious data entry, and reducing errors. The platform also offers integrated video conferencing for administrative oaths for required affidavits. CloudGavel has been deployed in more than **500 agencies** in **13 states** and counting, with nearly **20,000 users** and **hundreds of thousands** of executed warrants.

How does it work?

Current warrant processing is time consuming and can involve many individuals traveling for physical signatures.

CloudGavel offers a better way:

Step 1

Officer or investigator uses the CloudGavel web app to generate a warrant.

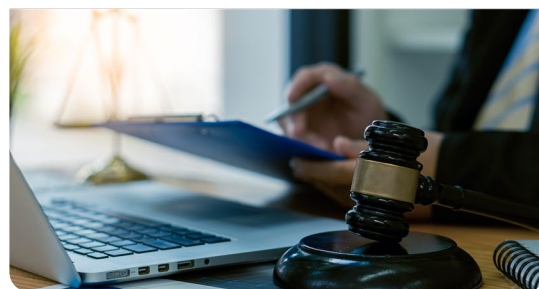

Step 2

The electronic warrant is securely sent to the prosecutor or judge for review.

Step 3

Judge approves warrant and it is sent back to the original requesting officer or investigator.
